# Your Hopes for This Session

- How to get to the point and give the quickest right answer
- How to get more useful replies
- Networking :)
- How to write a support request and what can I do to make sure it will be addressed
- How to submit best support requests and maybe create a template for that
- Learn to write clear and concise requests to our team of developers and web QA
- What others struggle with
- Learning is endless
- How the support team likes to have requests phrased, what works for them

# Quick Background

---

# Who is this guy?

1

## Former technical translator

Translated approximately 16 million words from Japanese into English, mostly technical docs

2

## Localization engineer, CAT nerd

Figure-outer of solutions to thorny problems, writer of nasty regular expressions, CAT tool user for 20 years

3

## Software development manager

Leader of a tiny team with big dreams that attempts to bring out the best of code and humans working together

**Nintendo + memoQ**

# Nintendo's memoQ use

Small compared to LSPs, larger for an enterprise?

- ~ 1.5 million documents processed
- 85 million words / 7.4 million segments currently in online projects
- 428 active users (764 lifetime)
- 400 custom filter configurations
- 1242 active projects
- 792 translation memories (curated actively!)
- 282 term bases

**No CAT tool\*  
is purr-fect**

# ...so we've written a lot of tickets

*I will ask the developers what they think about upgrading Hunspell itself.*

Thanks for this! I have no evidence to suggest that Hunspell has gotten faster since memoQ last updated this library, but it's possible at least, and it may also have gotten less buggy (we're having separate issues, which I know we need to report as a **separate ticket**, where random punctuation symbols like @, ^, ` , \_ and \ showing up as spell-check errors.

This·is·a·sample·This·has·a·typoe·Hunspell·incorrectly·flags·certain  
 punctuation·and·symbols·as·“typos”·—·`·~·!·@·#·\$·%·^·&·\*·(·)·-·

## [Feature Enhancement Request] Allow users to toggle whether XML preview shows source or HTML

Jeremy Bailey  
6 years ago

Hello Kilgray,

We'd like to suggest that when an XML file is imported using a filter that defines an XSL transform, users should be able to toggle the preview on (to see HTML) and off (to see XML source). This would make it easier to understand the structure of the document, and troubleshoot errors like "Only mq:ch and mq:rxt tags are allowed in translatable attr of an inline tag," which can happen if a user inserts a target-only tag into a segment that doesn't show up in the preview (such as the text of a tooltip).

Without such a feature, it can be very tricky to isolate which segment is causing an error that prevents the document from being exported. The usually-useful XSL-based preview in memoQ can occasionally hamper usability by making it impossible to see the markup. The troubleshooting technique we've shared with our users is shown below for reference.

### Problem

When attempting to export an XML document, a general error occurs with the following message.

*Only mq:ch and mq:rxt tags are allowed in translatable attr of an inline tag.*

**RELATED IDEAS**

Apply double filter to translation grid and then propagate = crash

## Fix bug of 'ignore all' button

There are a number of instances when, on the translation grid, the options for 'Ignore' and 'Ignore all of this kind' is greyed out. Please fix this bug (or make the feature available) to be able to click these buttons in all case.

The 'Ignore All' button is great when I clearly see that a memoQ warning can be safely ignored for all the segments I see in front of me. However, there are a number of instances where this button is greyed out and won't let me click it. I can't even click the 'Ignore' button for just that one segment.

# What's missing?

**To:** support@memoq.com

**Cc:** My Boss; Zsolt Varga

**Subject:** MT problems

I'm been having problems using MT since upgrading to memoQ 10.5. The results don't show up at all and they used to work just fine before. I need this to work because I have a big MTPE job on a quick deadline.

# Key components of a decent request

**To:** support@memoq.com

**Subject:** [Low/Normal/High] Priority | Removing duplicates from legacy online TM caused lockup/corruption

[Overview]

Attempting to remove duplicates in an online translation memory causes my laptop to lock up using memoQ 10.6.11 client against a TM on a remote server running memoQ TMS 10.6.8.

[Details]

Eventually I had to force-quit the application and the TM became corrupt. We are not using TM+ yet. I will look into the feasibility of sending the TM securely if you can set up an FxHub workspace. In the meantime, I wonder if you can reproduce this problem on a server-based legacy TM (not TM+) with approximately 300,000 entries, where Japanese is the source language and English (United States) is the target language.
